

Document variations handled seamlessly

\$2500 worth of human effort saved every month

- A major Shipping company spent thousands of dollars on data entry for their Bills of Lading.
- Format variability and excessive content (at least 5 text fields and multiple tables) made this process tedious.
- With each Bill of Lading requiring 5,000+ keystrokes, data accuracy took a hit. And even with a (manual) maker checker, accuracy continued to remain a pain point.

Solution

- We trained Neutron using samples of the various formats and then initiated the data extraction process.
- With ML at its core, Neutron learned and got better.
- 6 months post-deployment, the client saw 90% accuracy in data identification and extraction.

The Benefits

With key resources now focused on revenue-generating activities along with significantly faster processing, the client enjoyed a substantial positive impact on their bottom line.
