

*“Synthetic monitoring is critically important to check applications and address issues before real users encounter them. Robots can evaluate how a web application can perform in different geographies and help in detecting bottlenecks.”*

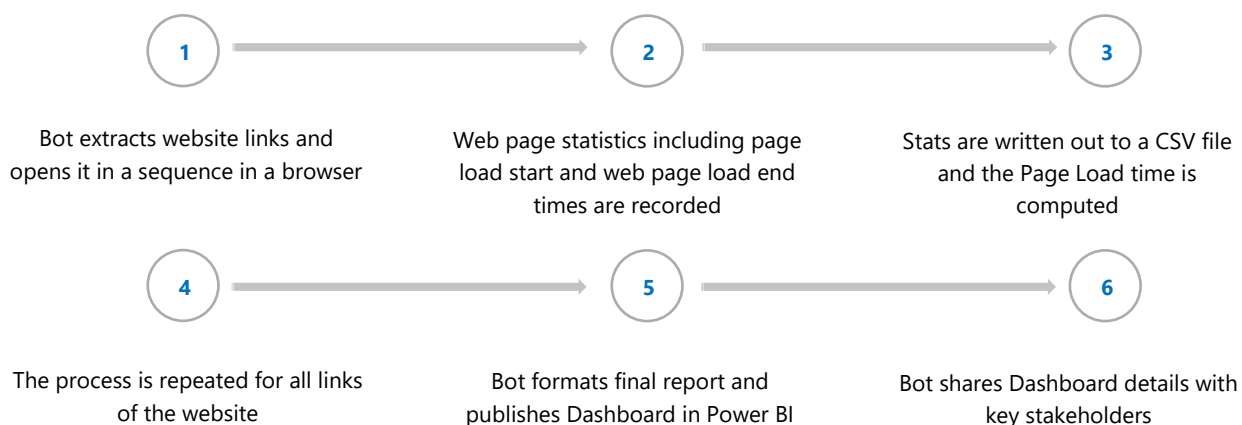

## Web Page Performance Dashboard

RPA for monitoring websites and streamlined reporting

### Site-monitoring bot to track website performance

Load time speaks a ton for overall performance and if monitored regularly can detect patterns of delay caused due to a new fix/release, Database Performance, thereby sending out call for action. Most e-commerce portals engage human resources to create such reports and periodically review the causes of non-performance in comparison with previous data. RPA bots that are used to monitor sites, gather statistics and generate reports for Stakeholders, improve metrics of the monitoring & reporting activity in all aspects.
